If the club bought 2.5 times as many eight-dollar tickets than the number of twelve-dollar tickets and four fewer fifteen-dollar tickets than 7/10 the number of twelve dollar tickets, how many of each type of ticket did the club buy?

Answer: Let the number of $12 tickets be \( x \).

Answer: Let the number of units of Product A be \(x\).

Number of units of Product B = 150 - \(x\).

Number of hours for Product A = 4\(x\).

Number of hours for Product B = 7(150 - \(x\)).

\[
4x + 7(150 - x) = 810

\[
4x + 1050 - 7x = 810

\[ N = N_0 \times \frac{-t}{e^{\tau}} \]

where,

\( N \) = Decay rate of the artefact, expressed as disintegrations per minute (dpm)

\( N_0 \) = Decay rate of natural carbon = 14 dpm

\( \tau \) = Mean life time = \( \frac{\text{Half-life of } C-14}{\ln 2} \) = \( \frac{5730}{\ln 2} \) = 8267 years

\( t \) = Age of the artefact

Calculate the age of the artefact, if the decay rate of the artefact is measured as 4 dpm

Answer: \( N = N_0 \times \frac{-t}{e^{\tau}} \)

\[ \Rightarrow \frac{N}{N_0} = \frac{-t}{e^{\tau}} \]

\[ \Rightarrow \ln \left( \frac{N}{N_0} \right) = \frac{-t}{\ln(e)} \]

\[ \Rightarrow \ t = -\tau \times \ln \left( \frac{N}{N_0} \right) \] because \( \ln(e) = 1 \)

Plugging the values in the above equation, we get:

\[ t = -8267 \times \ln \left( \frac{4}{14} \right) \]

\[ \Rightarrow \ t = -8267 \times -1.253 \]

\[ \Rightarrow \ t = 10357 \]

Answer: \( N = N_0 \times \frac{-t}{e^{\frac{t}{\tau}}} \)

227) Sobeys sells fruit trays consisting of pineapple and melons. The manager of the fruit department obtains pineapples at a wholesale price of $2.50 per kg, grapes at $2.15 per kg, strawberries at $1.50 per kg and melons at $1.85 per kg. He is required to produce 10 kg of the mixed fruit. He is required to add 2 kg of strawberries and 3 kg of grapes. What is the maximum weight of pineapple that he can put in the mix in order to have an effective wholesale cost no greater than $2.00 per kg?
Answer:  Cost of 2 kg of strawberries = $1.50 × 2 = $3.00
Cost of 3 kg of grapes = $2.15 × 3 = $6.45
Total cost of the mixed fruit = $2 × 10 = $20
Cost of pineapple and melons = $20 - ($3 + $6.45) = $10.55 ⇒ 2.5p + 1.85m = 10.55
Maximum weight of pineapple and melons = 10 - (2 + 3) = 5kg
∴ 2.5p + 1.85(5-p) = 10.55
⇒ 0.65p + 9.25 = 10.55
⇒ p = \frac{10.55-9.25}{0.65} = 2
∴ Maximum weight of pineapple = 2 kg
